Future surgery after revision shoulder arthroplasty: the impact of ~~X~~nexpected positive cultures

J Shoulder Elbow Surg (2017)

Eric M. Padegimas, MD[a], Cassandra Lawrence, BS[a], Alexa C. Narzikul, BA[a], Benjamin M. Zmistowski, MD[a], Joseph A. Abboud, MD[b], Gerald R. Williams, MD[b], Surena Namdari, MD, MSc[b,*]

- N = 28 culture positive, 89 culture negative
- 2 of 28 (7.1%) patients with UPCs required future surgery,
  - 1 case of positive cultures (1/6) during revision
- 18 of 89 (20.2%) patients without UPCs required 25 additional surgeries
  - 3 cases of positive cultures during revision

Abx Protocol:

- 18 of 28 (64.3%)patients received IV antibiotics for 6 weeks postoperatively
- 10 of 28 (35.7%) received a routine 2-week empirical antibiotic regimen

ROTHMAN INSTITUTE

Sidney Kimmel Medical College at Thomas Jefferson University

Antibiotics?

Single-Stage Revision Is Effective for Failed Shoulder Arthroplasty with Positive Cultures for Propionibacterium

J Bone Joint Surg Am. 2016;98:2047-51

Jason E. Hsu, MD, Jacob D. Gorbaty, MD, Ian J. Whitney, MD, and Frederick A. Matsen III, MD

- **N = 27 Culture positive, 28 Control**
- **11% reoperation in both groups, 0 for infection**
- **Abx protocol:**
  - high index of suspicion: IV ceftriaxone and IV vancomycin for 3 weeks
  - low index of suspicion: oral amoxicillin and clavulanate for 3 weeks
  - if 2+ cultures became positive: IV ceftriaxone and/or vancomycin and oral rifampin for 6 weeks followed by amoxicillin and clavulanate or doxycycline for a minimum of 6 months

42% antibiotic side effects (GI, derm, leukopenia)

ROTHMAN INSTITUTE

Sidney Kimmel Medical College at Thomas Jefferson University

Dual-Stage Revision

- >70 % converted to arthroplasties
- No difference in infection recurrence
- No difference in range of motion
- No reoperations for infection

(mean 4 years)

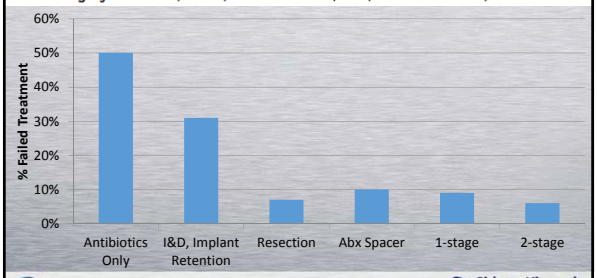
Sidney Kimmel Medical College at Thomas Jefferson University

Outcomes in the treatment of periprosthetic joint infection after shoulder arthroplasty: a systematic review

J Shoulder Elbow Surg (2016) 25, 1337–1345

Gregory N. Nelson, MD[a,*], Daniel E. Davis, MD[b], Surena Namdari, MD[b]



ROTHMAN INSTITUTE

Sidney Kimmel Medical College at Thomas Jefferson University

Conclusions

Diagnosis

- No ideal serum test
- No ideal point of care testing
- Need tissue
- High rate of positive cultures in primary and revision surgery
- *Cytokine Pofiles/PCR / Next Generation Sequencing?*

Treatment

- Explant, mechanical debridement, irrigation
- Single-stage sufficient for most, +/- antibiotics
- Dual-stage for obvious infection/aggressive organisms
- *Alter treatment based on host?*

Thank You

ROTHMAN INSTITUTE

Sidney Kimmel Medical College at Thomas Jefferson University
