Rehabilitation for Patellofemoral Problems:

It's Complicated!!!

DISORDERS OF THE PATELLA-FEMORAL ARTICULATION

Pathogenesis, Diagnosis & Treatment

PF Treatment-in 6 minutes!!!

- Objectives:
- 1. Introduction and background information
- 2. Examination of patient and PFJ
- 3. International consensus on treatments based on best evidence
- 4. Exercise, exercise, exercise
- 5. But how….

PF Treatment

- Treating patients with AKP is often frustrating, both for the orthopaedic surgeon and for the physical therapist.

Sanchis-Alfonso, V, et.al…Fulkerson, JP. Diagnosis and treatment of Anterior knee pain. JISAKOS. 1-13, 2016

PF Treatment

70-90% of individuals with AKP have recurrent or chronic pain

40% unfavorable recovery at 12 months after the initial diagnosis

Collins, NJ, et.al. Prognostic factors for PFP: a multi-center Observational analysis. BJSM. 47:227-233, 2013

PF Treatment

- Patients with AKP may also have an increased risk of developing PF – OA and no cure !!!
- AKP has a negative impact on the patient's quality of life

Crossley, KM. Is PF OA a common sequela of PFP? BJSM. 48:409-410, 2014

PF Treatment

- Because of the complex multifactorial etiology of AKP, with local, proximal, and distal factors potentially involved, its treatment is particularly difficult and challenging for the practitioner

Sanchis-Alfonso, V, et.al...Fulkerson, JP. Diagnosis and treatment of Anterior knee pain. JISAKOS. 1-13, 2016

PF Treatment

- Arriving at a precise diagnosis is the cornerstone of developing an appropriate treatment
- Given that the etiology of AKP is multifactorial, individualized treatment must be tailored to the patient

Sanchis-Alfonso, V, et.al…Fulkerson, JP. Diagnosis and treatment of Anterior knee pain. JISAKOS. 1-13, 2016

PF Treatment

- Since AKP is a multifactorial problem, non-operative management depends on the examination findings.
- Multimodal physiotherapy programs are effective in reducing AKP symptoms

Pathogenesis, Diagnosis & Treatment

If you want to use "your best treatment" interventions to treat the patient with PFPS , you can probably find some literature to support your clinical decisions.....

PF Treatment

- There is no evidence that a single treatment modality works for all patients with patellofemoral pain. There is limited evidence that some treatment modalities may be beneficial for some subgroups of patients with patellofemoral pain.

Selective activation of the vastus medialis oblique: What does the literature really tell us?

Vastus Medialis Oblique, Patellofemoral Pain, Anterior Knee Pain, Knee Rehabilitation

Anterior knee pain is one of the most common knee disorders seen in orthopaedic and sports physical therapy practice. Most articles that describe anterior knee pain rehabilitation emphasize a portion of treatment to the vastus medialis oblique muscle. Although conservative care appears to emphasize treatment of the vastus medialis oblique for patients with anterior knee pain, considerable disagreement exists in regards to treatment strategies and clinical outcomes. Furthermore, selective activation of the vastus medialis oblique has been proposed, yet remains to be a controversial rehabilitation treatment method. This article provides an overview of the scientific literature regarding the selective activation of the vastus medialis oblique, and based upon this literature, makes recommendations regarding application of selective vastus medialis oblique exercises to design a conservative rehabilitation program.

Le douleur du genou antérieur est l'un des troubles du genou les plus fréquents vus dans la pratique de l'orthopédie et de la physiothérapie du sport. La plupart des articles qui décrivent le traitement de la douleur du genou antérieur mettent l'accent sur une partie du traitement s'appliquant au muscle vaste interne oblique du membre inférieur. Bien que les thérapies conservatrices semblent accorder de l'importance au traitement du muscle vaste interne oblique du membre inférieur chez les patients souffrant de douleur du genou antérieur, les stratégies thérapeutiques et les résultats cliniques font l'objet de désaccords considérables. De plus, on a proposé l'activation sélective du muscle vaste interne oblique, mais cela demeure une méthode thérapeutique controversée. Cet article fournit un aperçu de la documentation scientifique sur l'activation sélective du muscle vaste interne oblique du membre inférieur et sur la base de cette documentation, fait des recommandations concernant l'utilisation d'exercices sélectifs au niveau du muscle vaste interne oblique du membre inférieur pour élaborer un programme de réadaptation.

Although a commonly discussed subject, more misinformation and anecdotal presentations may exist for muscular strengthening and patellar control than in nearly any other area of knee rehabilitation. Much of this is the result of the slow development of appropriate analyses of clinical efficacy in orthopedic rehabilitation (ie, few published significant clinical outcome studies related to these patients) but most importantly is related to the complex nature of the patellofemoral joint and its impact on function. Since the 1950s, generations of clinicians have been imbued with the concept that knee rehabilitation requires an emphasis on vastus medialis obliquus strengthening. Some of the early classic works included sage observations but have been interpreted in a manner that has led to long lasting misinformation. An interesting example is the work of Smellie (1962):

> The extensor apparatus may be regarded as consisting of two components, the rectus femoris, vastus lateralis and vastus intermedius, which extend the knee to within 10–15 degrees of full extension, and the vastus medialis which is selective in action and comes into force in producing the last 10–15 degrees of extension, although it may be used throughout the whole range in overcoming marked resistance [1].

He also labeled the vastus medialis "the key to the knee" and expressed "it is the vastus medialis which is almost entirely responsible for the stabilization and protection of the joint from injury [1].

Lieb and Perry addressed three major points in their anatomic/mechanical analysis in 1968 [2]. They determined that some of these observations are related to the thin fascial covering of the vastus medialis, the orientation of longitudinal and oblique fibers in the medialis, the independent innervation of

PF Treatment

- Patients with more pain, better function, greater lateral core endurance, and less anterior core endurance were more likely to have a successful outcome after hip and core strengthening (88% sensitivity and 54% specificity).

PF Treatment

- Patients with lower weight, weaker hip internal rotation, stronger hip extension, and greater trunk-extension endurance were more likely to have success after knee strengthening (82% sensitivity and 58% specificity).

PF Treatment

- Since AKP is a multifactorial problem, non-operative management depends on the examination findings
- A multi-modal PT program is effective in reducing AKP symptoms
- 1) unload the painful soft tissue around patella (LOCAL)
- 2) improve PF tracking (LOCAL)
- 3) optimize the LE mechanics (Proximal)(Distal)

PF Rehab-Outcomes

- CONCLUSION:
- Change in fear-avoidance beliefs about physical activity was the strongest predictor of function and pain outcome.
- The fact that patients who decreased their fear-avoidance beliefs improved function and decreased pain indicates that perhaps fear-avoidance beliefs should be targeted during the treatment of patients with patellofemoral pain syndrome.

Recommendations from the Expert Panel

PF Rehabilitation

- 1. Exercise therapy is recommended to reduce pain in the short, medium and long terms and improve function in the medium and long terms.
- 2. Combining hip and knee exercises is recommended to reduce pain and improve function in the short, medium and long terms, and this combination should be used in preference to knee exercises alone.
- 3. Combined interventions are recommended to reduce pain in adults with patellofemoral pain in the short and medium terms. Combined interventions as a management programme incorporates exercise therapy as well as one of the following: foot orthoses, patellar taping or manual therapy.
- 4. Foot orthoses are recommended to reduce pain in the short term.
- 5. Patellofemoral, knee and lumbar mobilizations are not recommended in isolation.
- 6. Electro-physical agents are not recommended.

PF Rehabilitation

PF Rehabilitation

- 2. Combining hip and knee exercises is recommended to reduce pain and improve function in the short, medium and long terms, and this combination should be used in preference to knee exercises alone.

PF Rehabilitation

- Movement control training was no more effective than the isolated strengthening protocol in terms of pain, function, muscle strength, or kinematics

Rabelo, NDDA, et.al. Adding motor control training to muscle strengthening did not substantially improve the effects on clinical kinematic outcomes in women with PFP: a randomized controlled trial. Gait Posture, 2017

PF Rehabilitation

- 3. Combined interventions are recommended to reduce pain in adults with patellofemoral pain in the short and medium terms.
- Combined interventions as a management program incorporates exercise therapy as well as one of the following: foot orthoses, patellar taping or manual therapy.

PF Treatment

- Unloading painful tissue around the knee:
- Improves the position of the patella on the femur and decrease the stress through an abnormally loaded structure

Sanchis-Alfonso, V, et.al...Fulkerson, JP. Diagnosis and treatment of Anterior knee pain. JISAKOS. 1-13, 2016

PF Rehabilitation

- 4. Foot orthoses are recommended to reduce pain in the short term.

PF Treatment

- PFP is multifactorial and often persistent knee condition
- 16 factors were reported to be associated with a poor outcome
- Longer duration of symptoms the most reported (>4 months)
- Midfoot mobility may predict those who have a successful outcome to foot orthoses

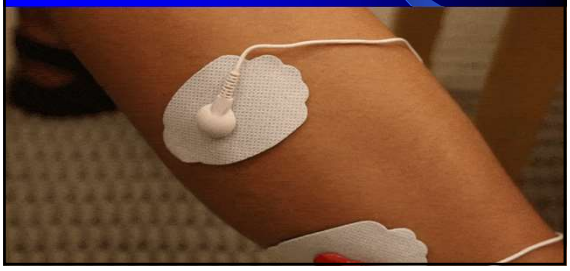
Matthews, M, et.al. Can we predict the outcome for people With PFP? A systematic review on prognostic factors and Treatment effect modifiers. BJSM. 1-12, 2016

PF Rehabilitation

- 5. Patellofemoral, knee and lumbar mobilisations are not recommended in isolation.

PF Rehabilitation

- 6. Electrophysical agents are not recommended.



PF Rehabilitation

- The 2017 consensus meeting also highlighted additional areas of uncertainty, being the use of blood flow restriction training and gait retraining.

PF Rehabilitation

- Exercise therapy remains the intervention of choice for patellofemoral pain

Exercise Dosing with PFP

- Recommendations:
- Various exercises (both OKC and CKC)
- Single session duration: 30-120 minutes
- Total sessions: 12-24 supervised
- Duration: 3-16 weeks
- Outcome measures: Numerous
